```

Fragments and variants of the sequence are claimed incorporated into a non-pathogenic host eg. E.coli, at high levels. The variants have a higher binding efficiency and capacity immunoglobulin, and may be used for purifying, detecting an esp.

, where d expressed

                                                                                                                                    A 2.4kb HindIII fragment containing the entire coding sequence for protein G was isolated from Streptococcus GX7805 using the 1.9kb Protein G coding sequence from Streptococcus GX7809. The Protein has IgG-binding activity which has been localised to the B repeat structure. Streptococcal Protein G variants comprising the B domastructure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptococcus

```
or antibody fragment to a liposome. The construct comprises protein G'
CC and a linking molety for connecting the protein G' to the liposome.
Also described are: (1) a liposomal delivery vehicle comprising: (a) a
CC liposome; and (b) a connecting molety connected to the liposome, which
specifically binds the Fc region of an antibody, for connecting the
CC aptibody to the liposoma; and (2) forming a liposomal carrier comprising:
CC (a) providing liposomal components having binding moleties, for forming
CC connecting molety bound together; and (c) combining the liposomal
CC connecting molety bound together; and (c) combining the liposomal
CC connecting molety bound together; and (c) combining the liposomal
CC connecting molety bound together; and (c) combining to that the
CC binding moleties are exposed on a surface of the liposome, for binding to
C the linking molety, and to facilitate the binding between them. The
CC agents. The liposomes may contain or may be associated with a diagnostic
CC artitumpuridenics, antivirals, cytokines, hormones, imaging agents.
                                                                                                                   antitumourigenics, antivirals, cytokines, hormones, imaging agents, neurotransmitters, or stimulants. They can be used particularly for the delivery of cytotoxic agents to malignant cells. The protein G' connecting molety provides a liposomal delivery complex having improved targeting efficiency. As a result of the binding between Protein G' and the Ec region of antibodies, protein G' shields the Ec regions of the
                                            attached antibodies from non-specific binding to cell-surproteins, and anatomical structures. The present sequence an unidentified protein and protein \mathbf{G}'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New liposome constructs comprising a liposome connected to an antibody, used, e.g. for delivery of cytotoxic agents to malignant cells \,\cdot\,

                                                                                                                                                                A phage lambda EMBL3 library of S. dysgalactiae 8215 DNA was analyzed for alpha-2-macroglobulin, BSA- and IgG-binding activity. Clone lambda-SD1, which expressed all 3 activities, was analyzed to obtain DNA encoding the SA-binding protein, MAG. The mag gene (given in Q86080) encoded a 44 kDa MAG protein (R71670).

Recombinant, immobilized MAG was used for serum albumin affinity

                                                                                                                                                                                                                                                                                                                                                                                                         A phage lambda EMBL library of S. dysgalactiae 8215 DNA was analyzed for fast-acting alpha-2-macroglobulin (FAM). BSA- and IgG-binding activity. Clone lambda-SD1, which expressed all 3 activities, was analyzed to obtain DNA encoding the FAM-binding protein, MAG. The mag gene (given in Q89197) encodes a 44 kDa protein (R71929).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding fast alpha 2-macro:globulin-binding proteins to obtain prods. for sepn., detection or quantification or binding inhibition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL040-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 12484; 21pp + Sequence Listing; English

                                                                                                                                                                                                                       A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAXI2938 to AAXI3919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecals nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-NOV-1997;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL018176-ABL30511), expressed DNA sequences (ABL018737-ABB72072).

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511).

AAX12938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences

The proteins produced by MD-1 are capable of specifically binding the constant region of the heavy chain of IgG in the same way as neutral Fc receptors. They can be used to analyse the structure and function of Fc receptors, as well as in antibody production, cell culture, diagnosis and therapy. They can be used to treat disorders such as leukaemia and lymphoma, cancer and immune disorders. See also AAQ84882-7.

                                                                                                                                                                                                          CC The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part CC from the printed specification, but was obtained in electronic format directly from WIPD at

The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets of or antiblotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

CC essential prokaryotic cellular proliferation form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Š
The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumonile, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used CC to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding to residues 34-192 and devoid of the membrane spanning region. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a mature GRAB protein from S. pyogenes strain SF370 without the signal sequence. This sequence is capable of binding alpha2M and useful in vaccine composition.
                                                                                                                                                                                                                                           GRAB protein; protein G related alpha2M binding protein; vaccine;

                                                                                                                                                                                                                                                                                                                                                                             The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequencies a full-length GRAB protein from S. pyogenes strain SF370.

GRAB protein; protein G related alpha2M binding protein; vaccalpha2-macroglobulin; group A Streptococcus; GAS; antibiotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to protein G of group G Streptococcus. GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequencis a partial GRAB protein from S. pyogenes strain KTL3.
                                                                                                                                                                                                                                                                                                                                                                              Streptococcus pyogenes strain AP1 partial GRAB protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses a new family of proteins termed GRAB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New alpha2M binding protein for generating a protective immune response to group A streptococcus and purifying the binding protein

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequent is a partial GRAB protein from S. pyogenes strain API.

The protein has alpha2M binding region and is useful in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 5; Page 60-61;

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain AP49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective lumnume response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a partial GRAB protein from S. pyogenes strain KTL9.
                                                                                                                                                      GRAB protein; protein G related alpha2M binding protein; alpha2-macroglobulin; group A Streptococcus; GAS; antibidimmune response; Streptococcus pyogenes infection.

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus byogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding to residues 34-174. This fragment is devoid of the trans-membrane and cell wall anchor regions. It is useful in machine.

GRAB protein and peptides derived from it are used in vaccine compositions for generating a protective immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequence is a fragment of GRAB protein from S. pyogenes strain SF370 corresponding to residues 34-91. This fragment is capable of binding alpha2M and useful in vaccine composition.
Protein G expressed by inserting the gene into an expression vector. A second vector may also be used as a cryptic helper plasmid to stably maintain the first plasmid in the host cell. Bacterial Fc receptors such as Protein G can be used to detect and purify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a new family of proteins termed GRAB (protein G related alpha2M binding protein) from Streptococcus pyogenes which have the ability to bind alpha2-macroglobulin (alpha2M) and show homology to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6

Fo receptors are useful to purify antibodies to be used in the purific. of protein drugs and as therapeutics. High levels of Protein G can be obtd. In conditions favourable for isolation, using a non-pathogenic host. Suitable cloning vectors are lambda gtll, Ml3mp9 and pcX1066.
                                                                             Protein G
